

Abstract

In order to reduce corrosion damage in the marginal edge region of a label, as can occur in particular in the case of metallized battery labels in an environment with high atmospheric humidity, it is proposed that, at or close to at least one portion of the peripheral edge (35) of the film layer (23) defining the label contour, the marginal edge (37) of a metallization layer (31) provided between a transparent plastic film layer (23) and a further covering layer (25) be sealed off by a sealing strip (41).
